Volume 9 Number 5, May 2015

ISSN 1996-0778

*Academic
Journals*

ABOUT AJBR

The **African Journal of Biochemistry Research (AJBR)** (ISSN 1996-0778) is published Monthly (one volume per year) by Academic Journals.

African Journal of Biochemistry Research (AJBR) provides rapid publication (monthly) of articles in all areas of Biochemistry such as Nutritional biochemistry, Analytical biochemistry, Clinical Biochemistry, Human and Plant Genetics, Molecular and Cell Biology, Enzymology, Toxicology, Plant Biochemistry, Biochemistry Education etc. The Journal welcomes the submission of manuscripts that meet the general criteria of significance and scientific excellence. Papers will be published shortly after acceptance. All articles are peer-reviewed.

Submission of Manuscript

Please read the **Instructions for Authors** before submitting your manuscript. The manuscript files should be given the last name of the first author

[Click here to Submit manuscripts online](#)

If you have any difficulty using the online submission system, kindly submit via this email ajbr@academicjournals.org.

With questions or concerns, please contact the Editorial Office at ajbr@academicjournals.org.

Instructions for Author

Electronic submission of manuscripts is strongly encouraged, provided that the text, tables, and figures are included in a single Microsoft Word file (preferably in Arial font).

The **cover letter** should include the corresponding author's full address and telephone/fax numbers and should be in an e-mail message sent to the Editor, with the file, whose name should begin with the first author's surname, as an attachment.

Article Types

Three types of manuscripts may be submitted:

Regular articles: These should describe new and carefully confirmed findings, and experimental procedures should be given in sufficient detail for others to verify the work. The length of a full paper should be the minimum required to describe and interpret the work clearly.

Short Communications: A Short Communication is suitable for recording the results of complete small investigations or giving details of new models or hypotheses, innovative methods, techniques or apparatus. The style of main sections need not conform to that of full-length papers. Short communications are 2 to 4 printed pages (about 6 to 12 manuscript pages) in length.

Reviews: Submissions of reviews and perspectives covering topics of current interest are welcome and encouraged. Reviews should be concise and no longer than 4-6 printed pages (about 12 to 18 manuscript pages). Reviews are also peer-reviewed.

Review Process

All manuscripts are reviewed by an editor and members of the Editorial Board or qualified outside reviewers. Authors cannot nominate reviewers. Only reviewers randomly selected from our database with specialization in the subject area will be contacted to evaluate the manuscripts. The process will be blind review.

Decisions will be made as rapidly as possible, and the journal strives to return reviewers' comments to authors as fast as possible. The editorial board will re-review manuscripts that are accepted pending revision. It is the goal of the AJFS to publish manuscripts within weeks after submission.

Regular articles

All portions of the manuscript must be typed double-spaced and all pages numbered starting from the title page.

The Title should be a brief phrase describing the contents of the paper. The Title Page should include the authors' full names and affiliations, the name of the corresponding author along with phone, fax and E-mail information. Present addresses of authors should appear as a footnote.

The Abstract should be informative and completely self-explanatory, briefly present the topic, state the scope of the experiments, indicate significant data, and point out major findings and conclusions. The Abstract should be 100 to 200 words in length. Complete sentences, active verbs, and the third person should be used, and the abstract should be written in the past tense. Standard nomenclature should be used and abbreviations should be avoided. No literature should be cited.

Following the abstract, about 3 to 10 key words that will provide indexing references should be listed.

A list of non-standard **Abbreviations** should be added. In general, non-standard abbreviations should be used only when the full term is very long and used often. Each abbreviation should be spelled out and introduced in parentheses the first time it is used in the text. Only recommended SI units should be used. Authors should use the solidus presentation (mg/ml). Standard abbreviations (such as ATP and DNA) need not be defined.

The Introduction should provide a clear statement of the problem, the relevant literature on the subject, and the proposed approach or solution. It should be understandable to colleagues from a broad range of scientific disciplines.

Materials and methods should be complete enough to allow experiments to be reproduced. However, only truly new procedures should be described in detail; previously published procedures should be cited, and important modifications of published procedures should be mentioned briefly. Capitalize trade names and include the manufacturer's name and address. Subheadings should be used. Methods in general use need not be described in detail.

Results should be presented with clarity and precision. The results should be written in the past tense when describing findings in the authors' experiments. Previously published findings should be written in the present tense. Results should be explained, but largely without referring to the literature. Discussion, speculation and detailed interpretation of data should not be included in the Results but should be put into the Discussion section.

The Discussion should interpret the findings in view of the results obtained in this and in past studies on this topic. State the conclusions in a few sentences at the end of the paper. The Results and Discussion sections can include subheadings, and when appropriate, both sections can be combined.

The Acknowledgments of people, grants, funds, etc should be brief.

Tables should be kept to a minimum and be designed to be as simple as possible. Tables are to be typed double-spaced throughout, including headings and footnotes. Each table should be on a separate page, numbered consecutively in Arabic numerals and supplied with a heading and a legend. Tables should be self-explanatory without reference to the text. The details of the methods used in the experiments should preferably be described in the legend instead of in the text. The same data should not be presented in both table and graph form or repeated in the text.

Figure legends should be typed in numerical order on a separate sheet. Graphics should be prepared using applications capable of generating high resolution GIF, TIFF, JPEG or Powerpoint before pasting in the Microsoft Word manuscript file. Tables should be prepared in Microsoft Word. Use Arabic numerals to designate figures and upper case letters for their parts (Figure 1). Begin each legend with a title and include sufficient description so that the figure is understandable without reading the text of the manuscript. Information given in legends should not be repeated in the text.

References: In the text, a reference identified by means of an author's name should be followed by the date of the reference in parentheses. When there are more than two authors, only the first author's name should be mentioned, followed by 'et al'. In the event that an author cited has had two or more works published during the same year, the reference, both in the text and in the reference list, should be identified by a lower case letter like 'a' and 'b' after the date to distinguish the works.

Examples:

Abayomi (2000), Agindotan et al. (2003), (Kelebeni, 1983), (Usman and Smith, 1992), (Chege, 1998;

1987a,b; Tijani, 1993,1995), (Kumasi et al., 2001) References should be listed at the end of the paper in alphabetical order. Articles in preparation or articles submitted for publication, unpublished observations, personal communications, etc. should not be included in the reference list but should only be mentioned in the article text (e.g., A. Kingori, University of Nairobi, Kenya, personal communication). Journal names are abbreviated according to Chemical Abstracts. Authors are fully responsible for the accuracy of the references.

Examples:

Chikere CB, Omoni VT and Chikere BO (2008). Distribution of potential nosocomial pathogens in a hospital environment. *Afr. J. Biotechnol.* 7: 3535-3539.

Moran GJ, Amii RN, Abrahamian FM, Talan DA (2005). Methicillinresistant *Staphylococcus aureus* in community-acquired skin infections. *Emerg. Infect. Dis.* 11: 928-930.

Pitout JDD, Church DL, Gregson DB, Chow BL, McCracken M, Mulvey M, Laupland KB (2007). Molecular epidemiology of CTXM-producing *Escherichia coli* in the Calgary Health Region: emergence of CTX-M-15-producing isolates. *Antimicrob. Agents Chemother.* 51: 1281-1286.

Pelczar JR, Harley JP, Klein DA (1993). *Microbiology: Concepts and Applications*. McGraw-Hill Inc., New York, pp. 591-603.

Short Communications

Short Communications are limited to a maximum of two figures and one table. They should present a complete study that is more limited in scope than is found in full-length papers. The items of manuscript preparation listed above apply to Short Communications with the following differences: (1) Abstracts are limited to 100 words; (2) instead of a separate Materials and Methods section, experimental procedures may be incorporated into Figure Legends and Table footnotes; (3) Results and Discussion should be combined into a single section.

Proofs and Reprints: Electronic proofs will be sent (e-mail attachment) to the corresponding author as a PDF file. Page proofs are considered to be the final version of the manuscript. With the exception of typographical or minor clerical errors, no changes will be made in the manuscript at the proof stage.

Fees and Charges: Authors are required to pay a \$550 handling fee. Publication of an article in the African Journal of Biochemistry Research is not contingent upon the author's ability to pay the charges. Neither is acceptance to pay the handling fee a guarantee that the paper will be accepted for publication. Authors may still request (in advance) that the editorial office waive some of the handling fee under special circumstances

Copyright: © 2014, Academic Journals.

All rights Reserved. In accessing this journal, you agree that you will access the contents for your own personal use but not for any commercial use. Any use and or copies of this Journal in whole or in part must include the customary bibliographic citation, including author attribution, date and article title.

Submission of a manuscript implies: that the work described has not been published before (except in the form of an abstract or as part of a published lecture, or thesis) that it is not under consideration for publication elsewhere; that if and when the manuscript is accepted for publication, the authors agree to automatic transfer of the copyright to the publisher.

Disclaimer of Warranties

In no event shall Academic Journals be liable for any special, incidental, indirect, or consequential damages of any kind arising out of or in connection with the use of the articles or other material derived from the AJBR, whether or not advised of the possibility of damage, and on any theory of liability.

Full Length Research Paper

Purification and biochemical properties of lipase from raphia palm fruit mesocarp

T. Okunwaye*, J.U. Obibuzor and E.A. Okogbenin

Biochemistry Division, Nigerian Institute for Oil Palm Research, P.M.B. 1030, Benin City, Edo State, Nigeria.

Received 15 January, 2015; Accepted 11 May, 2015

Lipases hydrolyze lipids to yield fatty acids and glycerol which are used as raw materials in industries. The lipase from raphia mesocarp was extracted, purified and characterized. Assay was carried out using *p*-nitrophenyl palmitate as substrate. The lipase was subjected to 80% ammonium sulphate precipitation, purified on ion exchange and gel filtration chromatography. Native and subunit molecular weights were determined on a gel filtration column and 10% sodium dodecyl sulphate polyacrylamide gel electrophoresis respectively. Kinetic parameters (K_m and V_{max}), effect of temperature, pH, sensitivity to metal ions and substrate specificities of the lipase enzyme were studied. Specific activity of 17.40 $\mu\text{mol}/\text{min}/\text{mg}$ and purification fold of 2.68% were obtained. Native and subunit molecular weight was 35 kDa. The K_m and V_{max} values were 0.01 mM and 20.5 $\mu\text{mol}/\text{min}/\text{ml}$ respectively. The lipase enzyme was inhibited by all metallic salts used and enhanced by CaCl_2 . Optimal pH was 7.0 and temperature for maximal activity was 40°C. The lipase hydrolyzed coconut oil at about twice the rate of palm kernel oil and palm oil, and at a higher rate than olive oil and Raphia oil. The study reveals that raphia mesocarp is a possible source of lipase which can be of industrial use.

Key words: Lipase, raphia palm fruit, mesocarp

INTRODUCTION

Lipases are a group of enzymes that catalyses the hydrolysis (cleavage) and synthesis of various forms of lipids (Svendsen, 2000). They belong to a subclass of the esterases and have been reported to be active at the oil water interface (Ibrahim, 1996). Oilseed lipases have great potential for commercial exploitation as industrial enzymes. The demand of lipolytic enzymes has been increased due to its potential use in the various manufacturing processes of industrial goods such as food

and pharmaceuticals (Boland et al., 1991; Gandhi, 1997), in the production of biodiesel and industrial detergent (Freire and Castilho, 2008) as well as in the analysis of triacylglycerols (Forgia et al., 1995), raw materials in food, cosmetics and pharmaceutical industries (Hermansyah et al., 2006). Fat splitting, with lipase as a catalyst, is advantageous compared to conventional process due to low energy consumption, low cost, high product quality, ease of purification and safer process.

*Corresponding author. E-mail: tonbra81@yahoo.com. Tel: +2347030505096.

The yield of plant lipases is low; sometimes it could be cheaper than other sources and does not require fermentation.

Lipase activity has been reported in several oil plant extracts which include castor bean, palm seeds, oleifera seed, sunflower seed, peanuts (Abigor et al., 2002; Henderson and Osborne, 1991; Khan et al., 1991) and palm fruit mesocarp (Abigor et al., 1985).

Raphia is an underutilized and under exploited plant that produces fruits, with improved agronomical practices; tons of the fruits can be produced for cheap source of lipase which can be used industrially. In this study we report the isolation, purification and characterization of lipase from raphia palm mesocarp to hydrolyze vegetable oils for production of fatty acid and glycerol.

MATERIALS AND METHODS

Raphia palm fruits were obtained from Mile 18 village, Edo State, Nigeria. Palm oil, coconut oil, palm kernel oil used for the hydrolysis reaction were obtained from Mega stone farms, Oba town, Ogun State, Nigeria. Raphia oil was extracted by soxhlet using n-Hexane as solvent and olive oil was bought from a supermarket in Benin, Edo State, Nigeria. All chemicals, reagents, resins, standard protein and solvents used in the experiment were of analytical grades and were obtained from Sigma chemical Company, St Louis, Mo., USA, Pharmacia Fine Chemical, Uppsala, Sweden and BDH Chemicals Limited, Poole, England.

Enzyme preparations

The Raphia fruit was allowed to ripe, the exocarp was peeled off and the mesocarp was scraped with a cleaned knife and homogenized for 5 min in 0.15M Tris buffer adjusted to pH 7.5 with KOH. The homogenate was filtered through one layer of cheese cloth and centrifuged for 30 min at 10,000g using High Speed Refrigerated Centrifuge. It yielded a fat layer, a supernatant liquid and a pellet. The supernatant was used for the assay of lipase activity and protein concentration determination. The remaining supernatant was fractionally precipitated using ammonium sulphate.

Assay of enzyme activity

Lipase activity was determined by the colorimetric method according to Lotrakul and Dharmstithi (1997). This method was based on the cleavage of *p*-nitrophenyl palmitate (*p*-NPP) at pH 8.0. The reaction contained 180 μ l of solution A (0.062g of *p*-NPP in 10ml of 2-propanol, sonicated for 2 min before use), 1620 μ l of solution B (0.4% triton X-100 and 0.1% gum Arabic in 50 mM Tris-HCl, pH 8.0) and 200 μ l of properly diluted enzyme sample. The product was detected at 410 nm wavelength after incubation for 15 min at 37°C. Under this condition, one unit of lipase activity (U) was defined as the amount of enzyme required to release 1 μ mol of *p*-nitrophenol (*p*-NP) per minute under standard assay condition.

Protein determination

Protein concentrations were determined according to Lowry's method (1951) using BSA (1mg/ml) as the standard protein, absorbance was read at 660 nm and a standard graph was plotted. The amount of protein present in the sample was estimated from

the standard graph.

Enzyme purification

The crude extract from the centrifugation step was fractionally precipitated to 80% ammonium sulphate saturation (516 g/L) according to the method of Doonan (1996). After standing for 1 h in an ice bath, the suspension was centrifuged at 10,000g for 15 min at 4°C, the supernatant discarded, and the precipitate collected and was dialyzed against Tris buffer for 4 h to remove traces of ammonium sulphate.

Ion exchange chromatography was performed using DEAE Sephadex A-50 as the resin. The resin was packed into a 1.5 x 40 cm column. 5ml of the dialyzed extract was carefully layered on the column bed surface that has been previously equilibrated with about 3 L of Tris buffer, pH 7.5, containing 1mM EDTA and was allowed to drain into the bed. The column was washed with Tris buffer to remove unbound protein, followed by elution with stepwise gradient of 1M NaCl in Tris buffer. Elution was performed at a flow rate of 30ml/h and fraction of 5ml each was collected. Protein was monitored spectrophotometrically at 280nm. The fractions were also assayed for lipase activity. The fractions having lipase activity were pooled stored in the refrigerator for further purification.

The enzyme fraction was further purified on gel filtration chromatography using Sephadex G-200 as the resin. 5ml of the DEAE-Sephadex sample was layered on the column (1.5 x 40cm). Elution was performed at a flow rate of 10ml/h and fractions of 5ml each were collected. Protein was monitored spectrophotometrically at 280nm. The fractions were also assayed for lipase activity. The fractions having lipase activity were pooled.

Determination of native molecular weight

The native molecular weight of lipase was determined by gel filtration on a column of Sephadex G-100 (1.5 x 100 cm) using the following protein markers: Blue Dextran (2,000Da), Gamma Globulin (150,000Da), Creatine phosphokinase (81,000Da), Bovine serum albumin (68,000Da), Ovalbumin (45,000Da), Alpha Chymotrypsinogen (25,700Da). Void volume (V_0) was determined using blue dextran. Apparent molecular weight was determined by semi logarithmic plot of V_e/V_0 against molecular weight of the marker proteins.

Determination of subunit molecular weight

The subunit molecular weight of purified lipase extract was analyzed with sodium dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) according to the method of Laemmli (1970) in 12% slab gel. About 0.1ml of purified protein was loaded onto the gel. The gel was stained with 0.1% Coomassie brilliant blue R-250.

Determination of kinetic parameters

The Michaelis-Menten constant (K_m) and the maximum velocity (V_{max}) were determined by measuring enzyme activity of the purified lipase at various concentrations of emulsified substrates. The kinetic parameters (K_m and V_{max}) were calculated by plotting $1/V$ against $1/[S]$ in Lineweaver Burk plot (1934).

Effect of temperature on enzyme activity

A thermostated, water-jacketed reaction chamber was employed in determining the temperature dependence of lipase activity. The

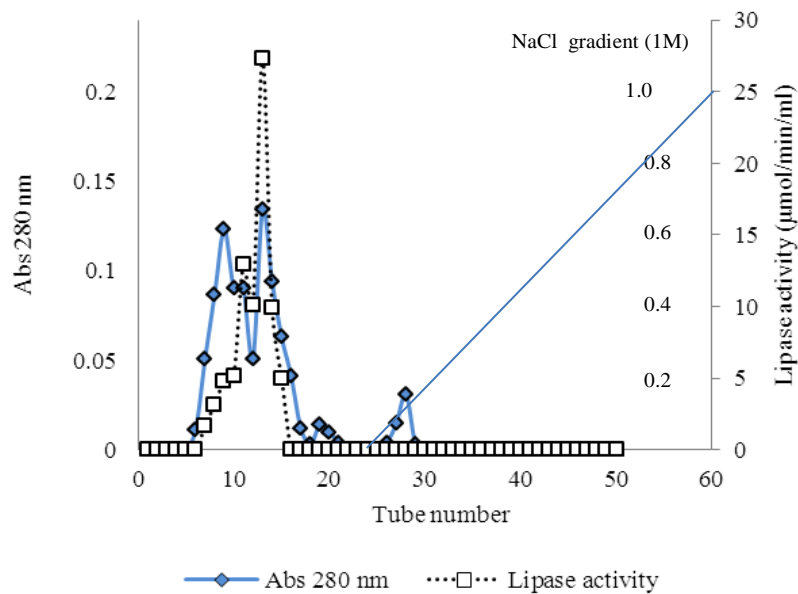

Figure 1. Elution profile of Lipase from raphia palm fruits on DEAE Sephadex A-50.

optimum temperature was determined by measuring the lipase activity at different temperatures of 30, 40, 50, 60, and 70°C after 1 h incubation at pH 7.5 at standard conditions. The values of lipase activities were plotted against temperature.

Thermostability of lipase

Thermal stability was determined by incubating the enzyme at different temperatures ranging from 30 to 70°C for various length of time (30, 60, 90, 120, and 150 minutes) at pH 7.5. Lipase activity was measured and expressed as a percentage of the lipase activity.

Effect of pH on enzyme activity

The effect of pH on the activity of purified enzyme was studied by measuring the enzyme activity at various pH range of 3.5 to 10.0 for 1 h at room temperature. The lipase activity was assayed under standard conditions.

Enzyme inhibition

The following salts at the concentration of 5– 20mM were tested for their possible inhibitory effects on the activity of the purified lipase enzyme: zinc chloride, manganese chloride, calcium chloride, potassium chloride and EDTA at room temperature for 1h and the lipase activities were determined.

Effects of substrates (hydrolysis reactions)

Palm oil, raphia oil, oliveoil, palm kernel oil and coconut oil were used as lipase substrates. The degree of lipolysis was determined by the assay method described previously above.

RESULTS

The elution profile of the crude extract from ion – exchange chromatography column of DEAE Sephadex A-50 is presented in Figure 1. The enzyme was not bound to the DEAE-Sephadex A-50 as it came out in the flow through fractions.No lipase activity was recovered in the fractions obtained by gradient elution. The crude protein was adsorbed on the DEAE- Sephadex A-50 column and this was eluted with a stepwise NaCl gradient(Figure 1), single peak was obtained. The active fractions from the peak was pooled together and used for further purification gelfiltrationchromatography. Single peak was also obtained, active fractions were pooled and used to assay the enzyme. A summary of the purification procedures is presented inTable 1. The partially purified enzyme from the mesocarp of raphia had a specific activity of 17.40 μmol/min/mg, a purification fold of 12.68 and a percentage yield of 5.79.

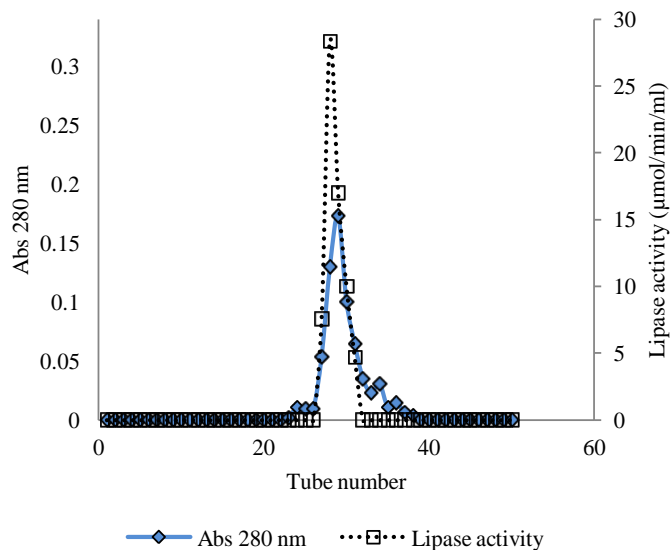

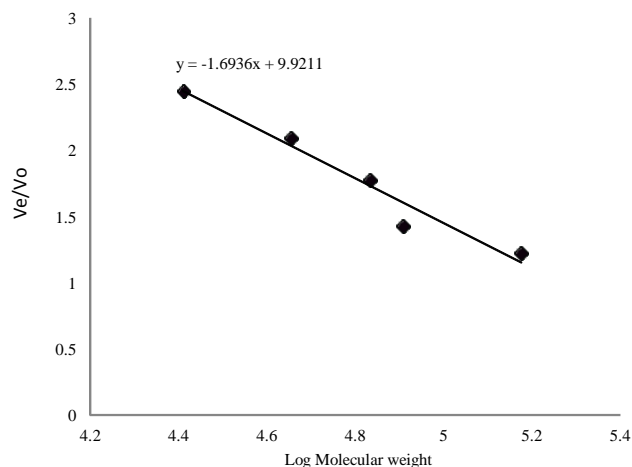

Five millilitre (5ml) of the dialyzed extract was carefully layered on the DEAE Sephadex A-50 column bed (1.5 x 40 cm) surface that has been previously equilibrated with about 3 L of Tris buffer, pH 7.5, containing 1mM EDTA and was allowed to drain into the bed. The column was washed with Tris buffer to remove unbound protein, followed by elution with 1M NaCl in Tris buffer. Elution was performed at a flow rate of 30ml/h and fraction of 5ml each was collected. Protein was monitored spectrophotometrically at 280 nm. The fractions were also assayed for lipase activity. The fractions 7 to 21 were pooled for further purification.

Five millilitre (5 ml) of the DEAE-Sephadex sample was

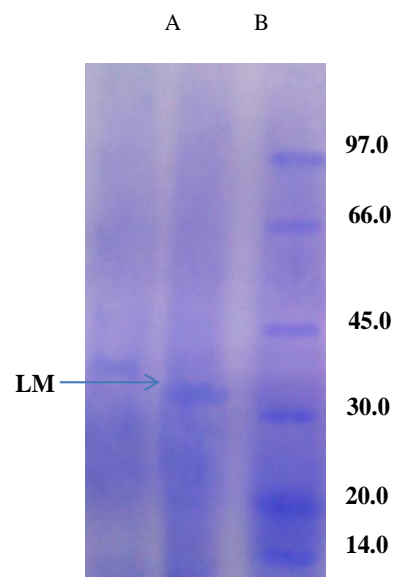

Table 1. Summary of purification of lipase from raphia palm mesocarp.

Step	Volume	LPA	LPC	TLA	TLP	SP	Yield	Fold
Crude extract	100.00	19.30	14.06	1930.00	1406.00	1.37	100.00	1.00

ml each were collected. Protein was monitored spectrophotometrically at 280nm (Figure 2). The fractions were also assayed for lipase activity. The fractions having lipase activity were pooled and used for analysis.

Molecular weights determination

The calibration curve on Sephadex G-100 (1.5 x 100 cm) for the determination of native molecular weight is shown in Figure 3. The native molecular weight of lipase from raphia mesocarp was 35 kDa.

The picture and calibration curve for the SDS-polyacrylamide gel electrophoresis on 12% slab gels of lipase from Raphia mesocarp is shown in Figure 4. The molecular weight of lipase was estimated to be 35 kDa.

The Lineweaver Burk plot indicating the (K_m and V_{max}) of lipase from raphia mesocarp is shown in Figure 5.

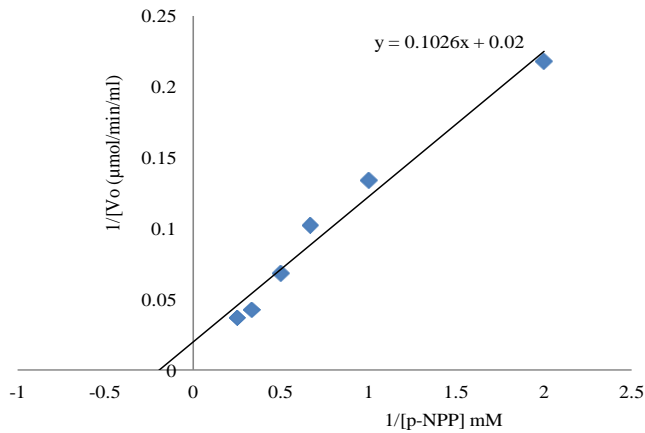

Figure 5. Lineweaver Burk plot of lipase activity (mesocarp of *Raphia palm.*) $K_m = 0.01$ mM, $V_{max} = 20.5$ $\mu\text{mol}/\text{min}/\text{ml}$.

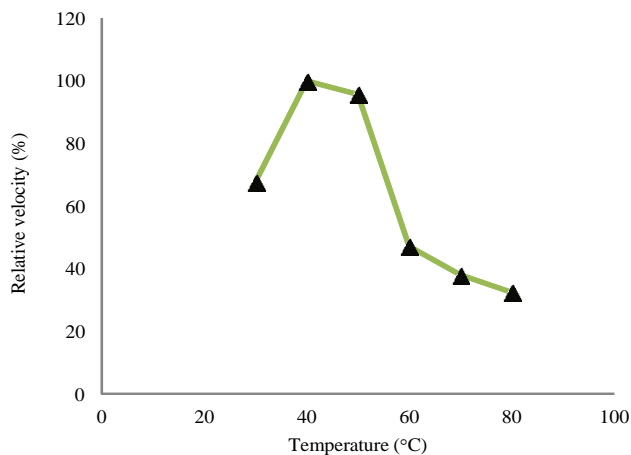

Figure 6. Effect of temperature on purified lipase from *Raphia palm* mesocarp.

The results on effect of temperature, thermostability, effect of pH on lipase from *Raphia* mesocarp are shown in Figures 6, 7 and 8 respectively. Figure 9 shows the hydrolytic activity of the lipase on some vegetable oils and the effect of salt of metal ions on lipase activity are seen in Figure 10.

DISCUSSION

The precipitation of the enzyme was carried out using ammonium sulphate since it was highly soluble in water, cheap and had no deleterious effect on structure of protein.

The specific activity obtained from the purification of lipase from *Raphia* mesocarp after further purification using Sephadex G 200 and DEAE Sephadex A-50 resins was 17.40, yield of 5.79% and purification fold of 12.68. Lipase from *Propionibacterium acidpropionicum* Sephadex

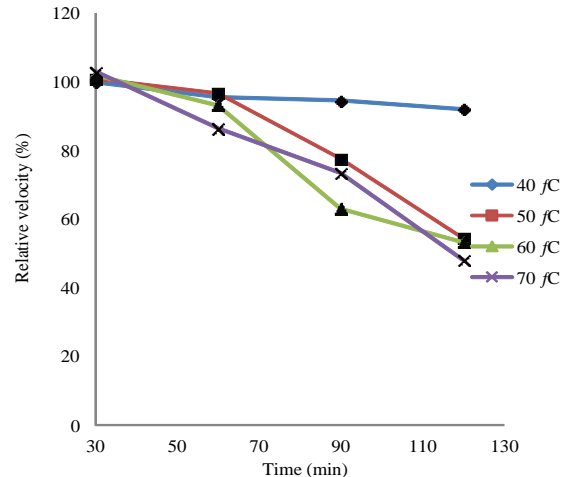

Figure 7. Thermostability of purified lipase from *Raphia palm* mesocarp. The activity at 30, 40, 50, 60, and 70°C was expressed as a percentage activity of the enzyme incubated at 30°C which was the control.

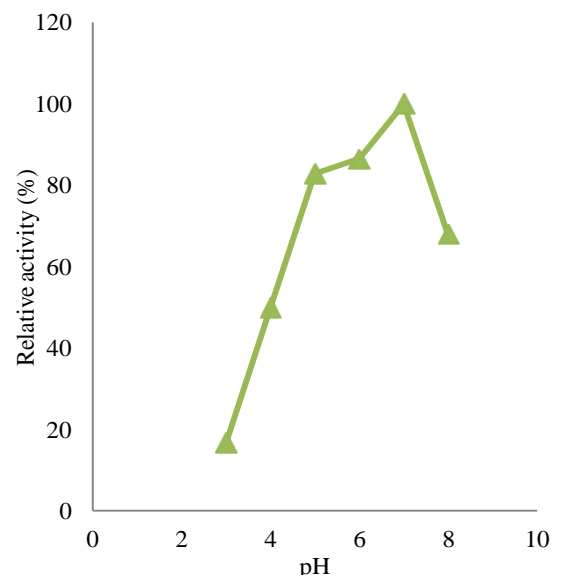

Figure 8. Effect of pH on lipase from *Raphia palm* mesocarp using citrate, pH 3.0-5.0, phosphate, pH 5.0-7.0 and Tris buffer, pH 7.0-9.0 at 0.05 M.

G-50 has a 33-fold increase in specific activity (Sarada and Joseph, 1992).

The purified lipase was monomeric and had a subunit and native molecular weight of 35 kDa obtained on gel filtration which is similar to the molecular weight of *Aspergillus niger* lipase 35 kDa on Sephadex G-100 gel filtration chromatography and SDS-PAGE (Sugihara et al., 1988), and also monomeric lipase of *Pseudomonas fragi*, and *Pseudomonas fluorescens* with molecular weights of 33 kDa.

In many cases, lipases appear to obey Michaelis-

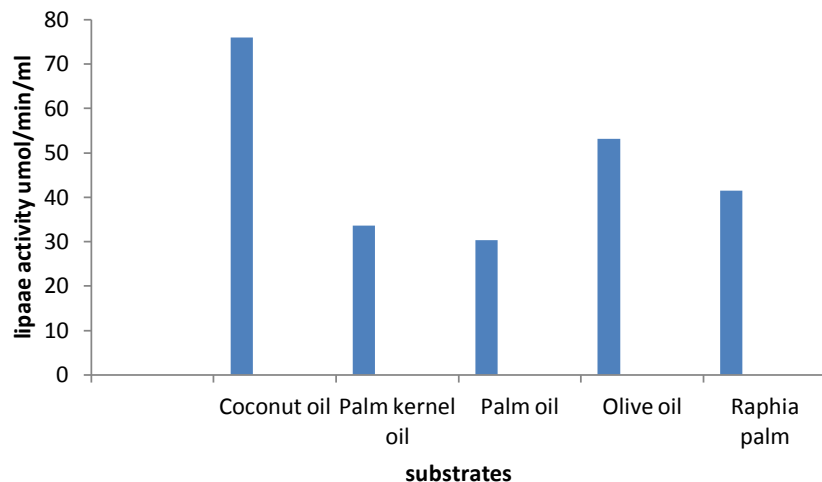

Figure 9. Hydrolytic activity of raphia fruit mesocarp lipase on some vegetable oils.

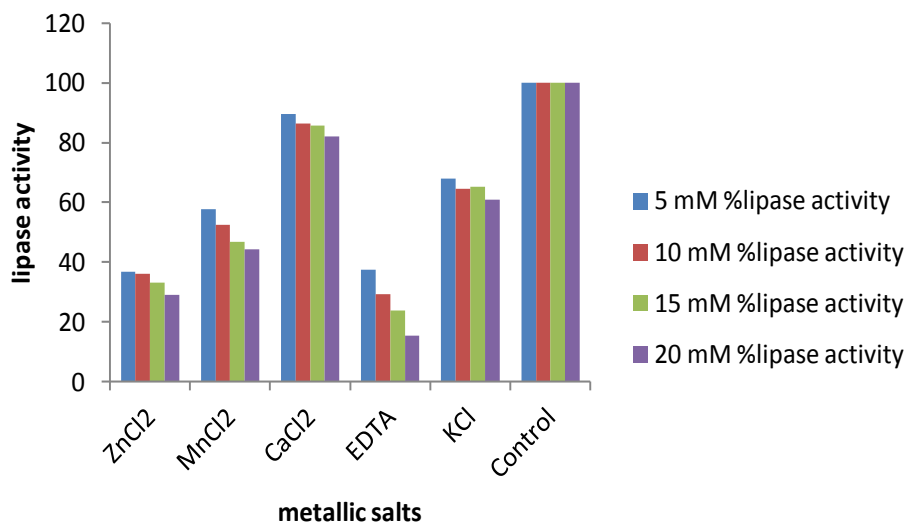

Figure 10. Effect of salts of metal ions on lipase activity from Raphia mesocarp.

Menten kinetics (Guit et al.,1991). Michaelis–Menten kinetics are characterized by two parameters, K_m and V_{max} . The latter is the maximum rate of reaction and K_m is a measure of the affinity of an enzyme for a particular substrate. The kinetic parameters (K_m and V_{max}) of lipase obtained by Lineweaver Burk plot when *p*-nitrophenyl palmitate was used as substrate were 0.01mM and 20.5 μ mol/min/mg for the mesocarp of raphia. For a *Pseudomonascepacia* lipase, Pancreac'h and Baratti (1996) reported V_{max} value of 30 mmol/min when pNPP was used as substrate. The K_m reported in this study is an indication that the enzyme from the germinated palm seeds has high affinity for the substrate and could catalyse the hydrolysis reaction for production of glycerol and fatty acid very fast.

One of the factors that affect the activity of enzymes is temperature and is often used to characterize enzyme. In this study, the optimum temperature of lipase from Raphia mesocarp was 40°C. Activity was rapidly lost at temperatures greater than 50°C. This is similar to the report of Abigoret al.(2003) on lipase from germinating seeds of *Jatropha curcas L.* Iftikhar et al. (2010c) reported that the optimum temperature for lipase from *Rhizopus oligosporus* was 40°C. The relative activity of the partial purified cocoa lipase has an optimum temperature range of 30- 40°C (Ratna, 2008).

The thermal stability experiment showed that lipase from this plant source was stable at 40°C for 60 min, retaining about 95% of its activity. The lipase enzyme was observed to be sensitive to thermal activation; this

could be attributed to thermal distortion of its structure.

According to Sharon et al. (1998), the changes in pH affect the protein structure and the enzyme activity. The maximum activity of lipase from raphia mesocarp was observed to be at pH 7 which dropped onwards, this is similar to results of lipase from germinating *Jatropha curcas* L. seed whose pH optima was near neutrality (Abigor et al., 2003), *Pentaclethra* lipase which was also near neutrality (Enujiugha et al., 2004) and partial purified cocoa lipase which had an optimum pH of 7.0 (Ratna, 2008).

Metal ions have been reported to stimulate lipase-catalyzed hydrolysis of oil by removing the fatty acids from the oil-water interface and allowing lipase to act freely on oil molecules (Ohnishi et al., 1994). From this study of the effects of metallic salts on lipase activity from raphia mesocarp, all the metal salts used inhibited the lipase activity at differing levels of inhibition. The highest level of inhibition was observed with Zn^{2+} while the least inhibition was observed with Mn^{2+} . Other salts used in this experiment inhibited the activity of the lipase enzyme. Monnet et al. (2012) reported that calcium ion was found to enhance lipase activity, while Mn^{2+} , Na^+ , K^+ , Fe^{3+} , Fe^{2+} and Zn^{2+} strongly inhibited the same. Sharon et al. (1998) reported a lipase of *P. aeruginosa* KKA-5 that retained its activity in presence of Ca^{2+} and Mg^{2+} but was slightly inhibited by Mn^{2+} , Cd^{2+} , and Cu^{2+} . Rahman et al. (2005) stated that metal ions will bind to the enzyme and change the enzyme's conformation to achieve better stability and hence greater activity. EDTA was also observed to inhibit the activity of the lipase and this is in agreement with the report of Monnet et al. (2012) that lipase from dormant ripe and unripe *Terminalia catappa* Linn were strongly inhibited by EDTA, thus suggesting that the lipases are metalloenzymes. According to Enujiugha et al. (2004), the inhibition could be attributed to its chelating process of the system and thereby disrupting the formation of the enzyme substrate complex. This invariably affects the formation of the end product (Enujiugha et al., 2004).

The result of the lipolysis activity shows that the enzyme hydrolyses coconut oil at a higher rate than other oils used. Palm oil and palm kernel oil were hydrolysed at comparable rates; also olive oil and raphia oil were hydrolysed at comparable rates. The result shows that the lipase hydrolyses medium chain triacylglycerol at a faster rate than long chain triacylglycerol. This is in contrast to the findings of Abigor et al. (2003), which reported that lipase from germinating *J. curcas* L. seeds hydrolyzed long-chain TAG than medium chain triacylglycerol.

In conclusion, apart from the fact that this work established the presence of lipase from Raphia mesocarp, it also revealed that this enzyme from these sources had some physico-chemical properties that are similar to what have been obtained from other plant and microbial sources. Some of these properties could make

the enzyme to find extensive applications not only in chemical, pharmaceutical, food, or leather industries but also in biodegradation of some materials.
