

Full Length Research Paper

Vegetation structure and composition in Guru Ghasidas Vishwavidyalaya in Central India

D. K. Patel

Department of Rural Technology, Guru Ghasidas Vishwavidyalaya, A Central University, Bilaspur, 495009, Chhattisgarh, India. E-mail: dplantscience@yahoo.co.in.

Accepted 4 September, 2012

Diversity of plants includes their presence and habit in specific ecological area. Plants' adaptability, genetic makeup and related environment influence their composition. This present study aims to assess vegetation on campus. A total number of 273 plant species belonging to 84 families were recorded, in which Fabaceae registered as the largest family with 38 plant species. Herbs showed their maximum presence (65.93%) followed by trees (19.05%), herb/climbers (6.96%) and shrubs (8.06%). Rich presence of phanerophytes showed tropical moist humid climatic condition. Conservation practices and sustainable management strategies are essential steps for protection of natural resources, especially for the diverse vegetational group. Recorded major families of vegetation composition were Fabaceae (42.85%), Asteraceae (21.42%), Apocynaceae, Solanaceae (11.90%), Amaranthaceae and Poaceae (10.71%), while other families showed intermediate number of species. The campus is rich with diverse plant species, and by obtaining proper information about it, prime efforts can be made to conserve it.

Key words: Diversity, habit, plant species, university campus.

INTRODUCTION

Information of plant diversity is needed for the study of dynamic nature of vegetation under specific eco-environmental situation. Ecology, which is the study of diversity of species, has been used for the analysis of pattern, causes of extinction and management practices (Huston, 1994). Awareness and understanding of environment as well as biological diversity is increasing daily due to its rapid and significant role in maintaining ecosystem. Most vegetational diversity and dynamics found in tropical moist area are due to availability of better environment to the plant species. Guru Ghasidas Vishwavidyalaya GGV-Bilaspur (CV) is a central university in Central India of around 700 acres area. The site has rich diversity of plant species.

Biological resources provided by nature are not only the source of ecosystem balance, but also useful to social communities (Heywood, 1995). Vegetation of a specified ecosystem leads to and regulates the process of sustainability of the ecosystem. Bio-species may vary due to climatic condition as well as the tolerance capacity

of the species in their natural habitat followed by their mode of propagation in next generation.

Species diversity and ecosystem fluctuation is regulated by human activities, deforestation, environmental changes, etc. Local climate of the area leads to the presence of the plant species followed by several environmental parameters, namely, temperature, pH, moisture, soil, biological pressure, etc. So, it becomes urgent to protect the biodiversity using effective methods.

Vegetational diversity of an area is influenced by local environmental and geographical situation and rainfall (Arora, 1995). Effect of climate change on the flora of mountains is noticed by Stanisci et al. (2005). Land management of ecosystem is a remarkable and key part of conservation of biodiversity. Odland and Birks (1999) reported that the population of vascular plants decreases with increase in altitude.

Tropical moist area includes rich species diversity. Many studies have been carried out on plant diversity of

different parts of the world (Shimizu, 1991; Hussain et al., 2000; Aparajita et al., 2002; Banda et al., 2006; Kumar et al., 2006; De, 2007; Stanisci et al., 2005). Plant species respond to their environment (Harrison et al., 2001). Plant species are in high risk due to variable morphological structures (Daehler, 1998). Wilby (2007) focused on the problems of management of aquatic plants.

The aim of this study is to record the plant diversity on GGV campus for exploration of the variation in plant species based on field observations. It is a prime attempt to assess and have inventory knowledge of the plant species on GGV-Bilaspur campus (CG). Current study will be helpful for further studies in the related field.

MATERIALS AND METHODS

The present research was conducted during September 2009 to October 2010. Multiple random field observation was carried out for assessment of plants diversity (Phyto-sociological analysis) distributed on the campus. Bilaspur (CG) is a major city of Chhattisgarh State and GGV is a central university (area around 700 acres). The area is situated between 21°47' and 23°8' north latitudes and 81°14' and 83°15' east longitudes. It has an average elevation of 264 m (866 ft) near the banks of the rain-fed Arpa River with black-sandy soil (Figure 1). The climate of the area is tropical. It is hot and humid, because of its proximity to the Tropic of Cancer and depending on the monsoons for rains. There are medium rains in the monsoon season. Its summer is very hot with temperature between 30 and 47°C and between 5 and 25°C in winter.

Identification of plants was done by experts, literature, flora, and herbarium (Haines flora) and the plants were documented by following their botanical name, family, habits, and propagation method of the individual plants.

RESULTS

A total number of 273 plant species belonging to varied families (84) with different habits were recorded (Table 1). They were the major vegetation in the university campus.

Out of these plants species, herbs (180), herb/climber (19), shrubs (22), and trees (52) were noticed. Maximum plant species were recorded for Fabaceae family, whereas 39 families include single species in the university campus. Observed plant species with their family, habit, and propagation methods are listed in Table 1. Table 2 shows the family wise distributions of plants and in Table 3, the number of different habits is given. Table 4 shows plant species range belonging to their family, and in Table 5, propagation methods of different plant species are listed.

DISCUSSION

On the basis of the present findings, it is concluded that the university campus is enriched with various plants of different habits, and the knowledge about the plant

species is essential for assessing them, though further strategy is needed to conserve them.

Plant species diversity (Shrubs) in Central Himalayan Region was recorded by Rikhari et al. (1997) and Ram et al. (2004). Pant and Samant (2007) reported that high biodiversity is due to variation in habitats and related environmental situations. Conserving the genetic diversity of plants is beneficial for current and also for coming generations (Olowokudejo, 1987). Carrying capacity of each ecosystem has a significant impact on long term basis and it sustains the utilization of available natural resources. Proper monitoring of the ecosystem is required for protecting the plant species.

This study indicates their rich diversity, followed by various habits (herbs, shrubs, and trees) due to suitable climatic condition as well as their survival capacity in the university campus. In the campus, herbaceous plants are mostly seen as they cover a larger part of the area (180 species of 65.93%), and are closely followed by trees (52 species of 19.05%), shrub (22 species of 8.06%) and herb/climber (19 species of 6.96%), the least of them all (Figure 2). The range base distribution related to their families was also investigated. The maximum number of plant species was recorded for a range of 0 to 5, with the plant species having a total of 67 families, whereas the single family Fabaceae which has the largest plant species has a range number of 38.

The most frequent plant species families were found in order of Fabaceae (38) > Asteraceae (18) > Euphorbiaceae, Lemnaceae (11) > Apocynaceae, Solanaceae (10) > Amaranthaceae, Poaceae (9) > Agavaceae, Araceae, Malvaceae (7) > Liliaceae, Moringaceae, Verbenaceae, Zingiberaceae (6) > Asclepiadaceae, Convolvulaceae (5) > Acanthaceae, Myrtaceae, Rubiaceae, Rutaceae (4) > Annonaceae, Commelinaceae, Cucurbitaceae, Nyctaginaceae, Oxalidaceae, Polygonaceae (3) > Anacardiaceae, Apiaceae, Bixaceae, Combrataceae, Cypraceae, Hydrocharitaceae, Lytharaceae, Oleaceae, Palmae, Piperaceae, Rhmanaceae, Rosaceae, Scrophulariaceae, Vitaceae (2). The rest of the families listed in Table 2 includes single plant species.

This study also focused on the regeneration pattern of individual plant species as they propagate in new season/year for maintaining their existence in the campus. 67.40% of the studied plants show their propagation by seeds. 0.73 to 11.72% of the plants were propagated through seed/stem cutting, seed/tuber, rhizome, corm, bulb, bud, and tuber. Minimum percentage (0.38) of propagation by leaf was shown by *Kalanchoe pinnata* (Lam.) Pers.

Within the recorded mixed plant population, 11 species of the plants were aquatic in nature, recorded from water bodies in the campus. The aquatic plants are floating (*Azolla pinnata* R. Br., *Ipomoea aquatica* Forssk., *Lemna minor* Linn, *Nymphaea nouchali* Burm. F., *Pistia stratiotes* Linn, and *Trapa bispinosa* Roxb.) and submerged

273	<i>Ziziphus jujuba</i> Miller.	Rhamnaceae	Tree	Seed
274	<i>Ziziphus mauritiana</i> Lam.	Rhamnaceae	Tree	Seed

Table 2. Plant species distribution according to their families.

S/N	Family	Number of species
1	Acanthaceae	4
2	Agavaceae	7
3	Amaranthaceae	9
4	Anacardiaceae	2
5	Annonaceae	3
6	Apiaceae	2
7	Apocynaceae	10
8	Araceae	7
9	Araucariaceae	1
10	Asclepiadaceae	5
11	Asteraceae	18
12	Balsaminaceae	1
13	Basellaceae	1
14	Bixaceae	1
15	Bombacaceae	2
16	Bromeliaceae	1
17	Cactaceae	2
18	Cannaceae	1
19	Caracaceae	1
20	Ceratophyllaceae	1
21	Chenopodiaceae	1
22	Cleomaceae	1
23	Combretaceae	2
24	Commelinaceae	3
25	Convolvulaceae	6
26	Crassulaceae	1
27	Cruciferae	1
28	Cucurbitaceae	3
29	Cupressaceae	1
30	Cyperaceae	2
31	Dennstaedtiaceae	1
32	Dioscoreaceae	1

Table 2. Continued.

33	Euphorbiaceae	12
34	Fabaceae	36
35	Funariaceae	1
36	Hydrocharitaceae	2
37	Hypoxidaceae	1
38	Lamiaceae	11
39	Lemnaceae	1
40	Liliaceae	6
41	Linaceae	1
42	Lythraceae	2
43	Malvaceae	7
44	Marsiliaceae	1
45	Martyniaceae	1
46	Meliaceae	1
47	Menispermaceae	1
48	Moraceae	6
49	Moringaceae	1
50	Myrtaceae	4
51	Nyctaginaceae	3
52	Nymphaceae	1
53	Oleaceae	2
54	Orchidaceae	1
55	Oxalidaceae	3
56	Palmae	2
57	Papaveraceae	1
58	Passifloraceae	1
59	Pedaliaceae	1
60	Piperaceae	2
61	Plumbaginaceae	1
62	Poaceae	9
63	Polygonaceae	3
64	Portulaceae	1
65	Punicaceae	1
66	Rhamnaceae	2
67	Ricciaceae	1
68	Rosaceae	2
69	Rubiaceae	4
70	Rutaceae	4
71	Salicaceae	1
72	Salviniaceae	1
73	Sapotaceae	1
74	Scrophulariaceae	2
75	Simaroubaceae	1
76	Solanaceae	10
77	Sterculiaceae	1
78	Trapaceae	1
79	Typhaceae	1
80	Utricaceae	1
81	Utriculariaceae	1
82	Verbenaceae	6
83	Vitaceae	2
84	Zingiberaceae	6

Table 3. Distribution of plants as per their habit.

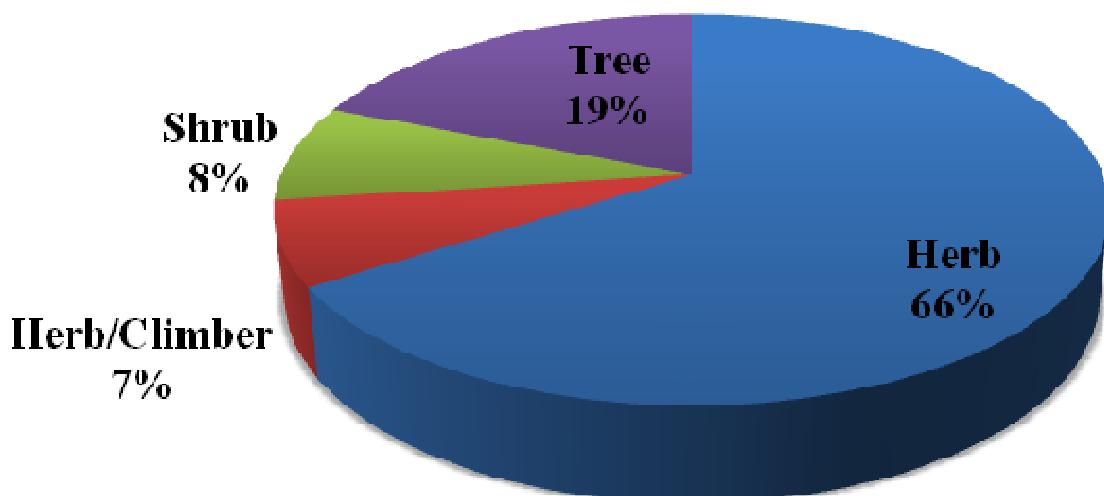

S/N	Habit	Number of plant species	Distribution (%)
1	Herb	180	65.93
2	Herb/Climber	19	6.96
3	Shrub	22	8.06
4	Tree	52	19.05
5	Total	273	100.00

Table 4. Range of distributed plant species with their family.

S/N	Plant species number range	Number of belonging family
1	0 - 5	69
2	6 - 10	11
3	11 - 15	02
4	16 - 20	01
5	20 - 40	01
	Total family	84

Table 5. Propagation methods of different plants.

S/N	Method	Number of plant species	Percentage
1	Seed	184	67.40
2	Seed/Stem cutting	016	05.86
3	Stem cutting	032	11.72
4	Seed/Tuber	002	0.73
5	Rhizome	013	4.76
6	Corm	002	0.73
7	Bulb	008	2.93
8	Leaf	001	0.38
9	Bud	013	4.76
10	Tuber	002	0.73
	Total	273	100.00

**Figure 2.** Habit of plants in percentage.
